BALLOON FLIGHT RECORD STATUS REPORT

as of 31 December 1963

School of Physics, University of Minnesota
Minneapolis 14, Minnesota

This tabulation is a continuation of five previous status reports.*

Balloon flights were launched from Minneapolis, Minnesota; Fort Churchill, Manitoba, Canada and International Falls, Minnesota. The flights used either the standard monitoring apparatus described earlier, or the scintillation counters to obtain more specific data about x-rays resulting from electron precipitation.

The tabulation gives the flight number, launch time, launch location, duration and type of instrumentation used on each of the flights. The flight duration is measured from launch time. The floating pressure altitude of the current balloon system is 6 mb. In general, the flights attained this altitude about two hours after the stated launch time. The balloons do not always float at a constant altitude, however, so that the detailed time-pressure curve for each flight is necessary for final analysis. An index for the types of instruments used is attached at the end of the tabulation. The original data from flights during 1960, 1961, 1962 and 1963 are being plotted in standard form and copied photographically on 5 x 7 inch negatives. We shall endeavor to furnish copies of these original graphs in a convenient size to qualified scientists in other laboratories. Nuclear emulsion packages were carried on most flights and are analyzed by the Nuclear Emulsion Group, School of Physics, University of Minnesota.

Inquiries about this project should be addressed to Professor J. R. Winckler, School of Physics, University of Minnesota, Minneapolis 14, Minnesota.

Instrumentation Code:

Standard = Ion Chamber, Single Counter, Telescope

SCI = Scintillation Counter

GT = Geiger Telescope

> = Termination time not known accurately at time of this report.

SC-A = Single Geiger Counter (Aluminum)

IC = Ion Chamber
